2 pole rotor winders _	
Â	
Â	
The FAOR12 automatic 2 pole rotor winding machine uses flyer winding technology and rotors with straight slots or skewed slots.	I is suitable for 2 pole
This machine is typically used in production lines for portable generators.	
The high speed flyer winding system is PLC controlled and is fully programmable.	
High precision layering of the wires directly into the slots provides excellent well balar rotor poles.	nced coils on both
This high performance 2 pole rotor winding machine can also be integrated into a full where it is possible to automatically load the slot wedges.	y automatic line
Rotors can be either loaded manually or automatically i.e by robot technology	
Â	
Â	
Â	
Â	
A 2 pole rotor is mounted vertically on a dual position rotating table which means that rounloaded within the machine winding cycle time. This therefore eliminates any downtime	
Â	
Safety light guards are also supplied as standard to make loading / unloading easy for the	ne operator.

The FAOR12 tooling is very robust and simple to fit into the winding area.

It is possible to flyer wind multiple copper wires through the high speed flyer head but a technical evaluation would have to be made before any proposals could be offered.
